

Using your DVD-2900 Modified SACD Player

The quality of sound from your upgraded Denon DVD-2900 DVD/SACD player is far better than that of the stock unit. In order to receive the best possible sound from your unit a few guidelines must be addressed.

- **Burn-in:** The unit must be allowed **at least 150 hours** of playing time to “burn in” before optimum sound quality will be achieved. Your upgraded unit has already been running for 24 hours before it was returned to you, but even the new LClock board takes at least 48 hours of running time to burn in. Please allow the unit time to burn in before making any subjective observations.
- **Cables:** The quality of your interconnect cables can also have a major effect on the sound quality. The use of low-quality interconnect cables can seriously hinder the sound that modification accomplishes. If the unit doesn’t sound right, then try different interconnects. There are many excellent cables available, and the best way to choose one is by in home audition.
- **Operation:** When switching discs, a pop or clicking sound will be emitted by the player as the DAC resets itself between discs. This is normal, as the player’s muting relays were bypassed to facilitate for a direct signal path. You should reduce the volume between discs although this pop is not loud enough to damage system components. This pop is common with players with current output DACs, and although inconvenient, the current output DAC is far superior to the voltage output types found in lesser players.

The normal multichannel front outputs are disabled.

The top center of the player feels warm to the touch. This is normal.

If you have any problems with the mods feel free to contact me immediately through my website: www.SACDmods.com All modifications are warranted from defects for 1 year from the date of installation.*

* Not responsible for damage due to electrical surges or lightning damage. Not responsible for customer negligence. Operation of this unit must be conducted in the same manner as described in the Denon owner’s manual. Modifying this player does void your manufacturer warranty. This warranty does not cover failures or defects in Denon components unless I can confirm it was caused by the modifications. **We service what we sell!**
